

Main Goals:

Create simple note todo app:

- User can write simple todo (title, body)
- User can save the todo item , the todo item is saved in database
- User can find his todo item in todo list
- User can tap on the todo item to check it or update it
- User can swipe to delete
- Show notification to user, 10 min before todo item time
- Please check the below wireframe

Main Requirements:

- Make yourself proud and write clean code with clean architecture pattern (MVVM)
- Use (kotlin - coroutines - koin/dagger - room)
- unit testing
- ui testing (espresso)

Additional information:

- You are free to use any open source libraries
- Unit testing and ui testing are very important to us
- Please don't upload your task in public repositories, please send it back by mail while having the commit history.
